

Resource Use Policy Statement

As a rebar fabricator, we utilise one single identifiable product, reinforced steel. As a result, our operation requires very limited natural resources compared to larger more complex businesses in other sectors of manufacturing. However, we still we do still consume other products and use other services, and it is our aim to do whatever we can to reduce the impact Leinster Reinforcements has on the natural resources we consume.

In order to reduce our impact, we aim to;

1. Recycle as many inward inputs as possible while maintaining quality
2. Maintain a high level of raw material efficiency in production
3. Where possible ensure all our equipment within our premises consume as little power as possible
4. Reduce packing to our customer and from our suppliers
5. To ensure that we purchase products from suppliers that have good environmental credentials and as high a recycled content as possible.

Internally we have requested that our staff and maintenance teams try to alter their behaviour to fall in line with this policy, behaviours such as turning machines and lighting off when not in use or at the end of shifts.

Ultimately the reduction in resources and utilities, the lower our consumption becomes and therefore improves the sustainable nature of the business as well as tangible rewards for our stakeholders.
